

New Pergola: HORIZON II

Our adjustable sunbreaker HORIZON is now equipped with a robust and silent electric cylinder. It allows a smooth slats opening to ideally adjust your terrace exposure to sunlight (opening in 60 seconds).

The cylinder allows to operate a slat frame up to 20m² (4m x 5m) thanks to its strength of 2400N. It is completely integrated inside the section, which makes it invisible when the slats are closed.

The cylinder fixation is realized by the fixation of two sliding parts inside the section and into the operating profile (no mechanization).

New wall fixation along the entire pergola length.
Simplified fixation and flat cassette for a greater refined design.

New fixation

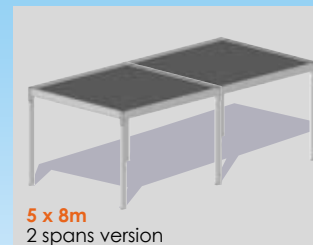

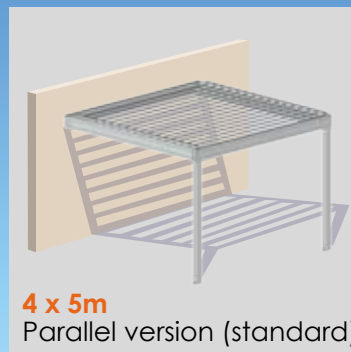

The new fixation system simplifies the installation thanks to the positioning adjustment.

The cassette is more compact, so easier to handle.

Perpendicular slats

The creation of new sections with wall mounting enables the slats opening parallel to the wall "ideal solution for southern exposure" or perpendicular to the wall "ideal solution for east or west exposure".

The maximum dimension of each span is now 20m².

The Pergola can be up to 5m in the projection in parallel or 5m in the width in perpendicular (no additional post).

- LED lighting system on 3 sides
- LED, slats opening and closing or side screens controlled by a centralized remote control.
- Wind and sun sensors
